

ABSTRACT OF THE DISCLOSURE

The pallet constructed of a rubber composite is made from rubber that includes recycled rubber, natural rubber, sulfur and a filler material. The pallet has an upper member and a lower member that interconnect to resemble a traditional American model wooden pallet. Although an assembly of just two molded components, it appears to be constructed of a number of planks attached to two or more cross beams. In an alternative embodiment, it resembles a European model wooden pallet by appearing to be constructed of a number of planks attached to two grids, each of which is attached to opposite surfaces on a plurality of support blocks.
